Pipes made of PE80 / PE100 / PE100-RC - advantages and properties

- Low weight
 - Flexible / easy to install
 - Highly versatile
 - Simple joining technique
 - Trenchless installation
 - Installation without sand bedding
 - Environmental friendly installation
 - Long lifetime
 - Cost saving installation methods
 - Cost saving application
 - Corrosion resistant
 - Good insulation behavior
 - High chemical resistance
 - Good abrasion resistance
-

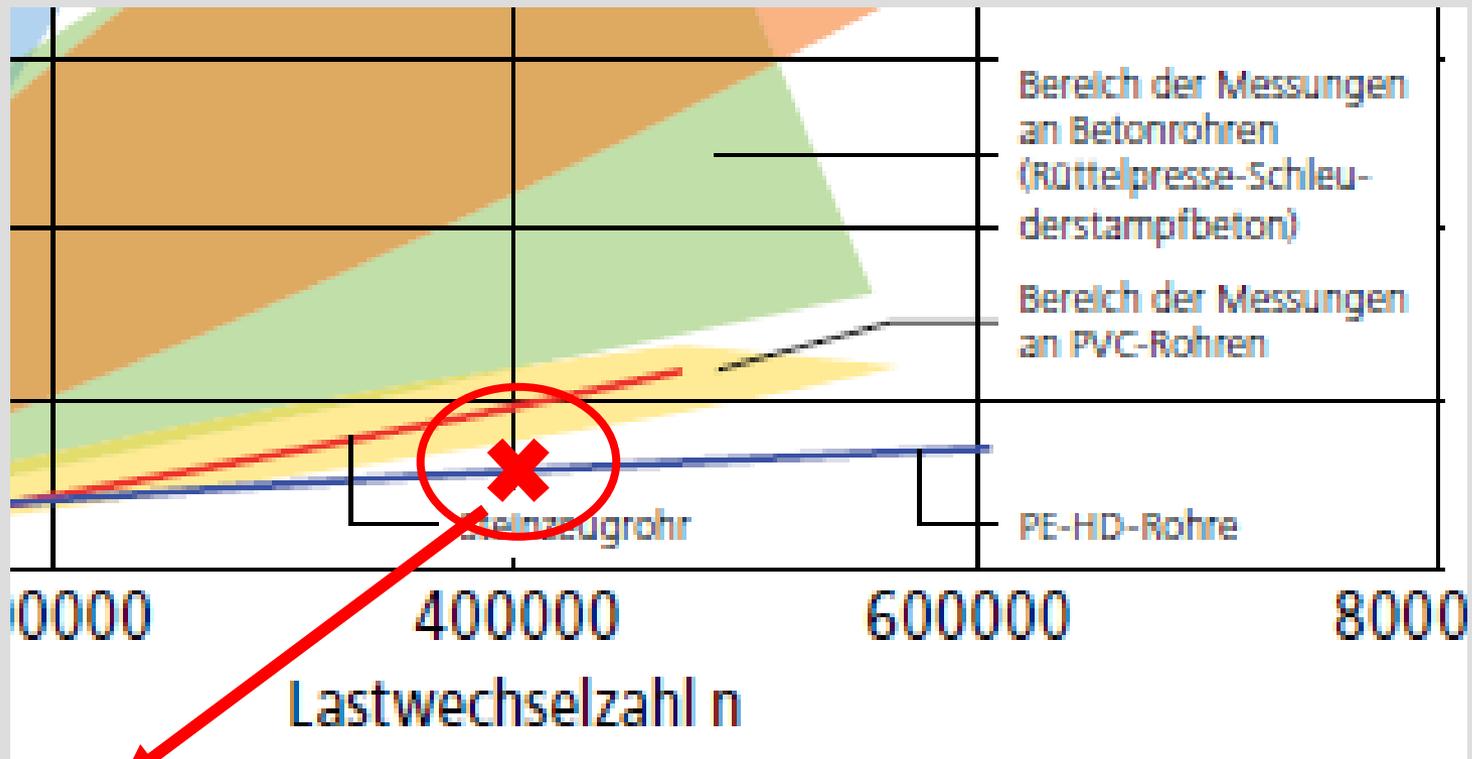

Polyethylene – a versatile material

- Good abrasion resistance

1.29 Verschleißmessungen in Anlehnung an DIN 58836 (Grafik: basell Polyolefins „Technisches Handbuch für Rohrwerkstoffe“, 08/02)

Good abrasion resistance

PE-HD: 0,3mm wear after 400.000 load changes in comparative test

➤ Significantly lower wear against stoneware, concrete, grp, and other pipe materials!

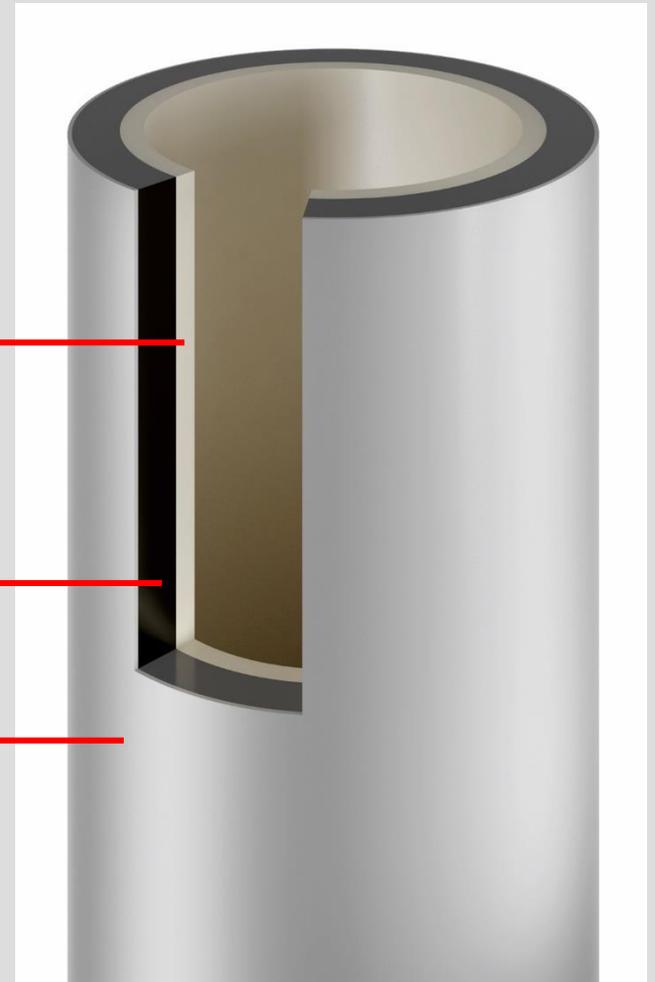

The pipe for the rough

Dimensionally integrated, inner protection layer made of thermoplastic elastomer for longtime stress of abrasive wear

Core layer made of PE100 or PE100-RC

Dimensionally integrated, co-extruded outer layer made of UV-stabilised PE100 or PE100-RC in bright colour for lower thermal stress of pipe system

Improvement of resistancy against abrasion

Transport of water together with solid mixtures affects the pipe wall => it becomes worn out – „abrasion“.

Basic rule:

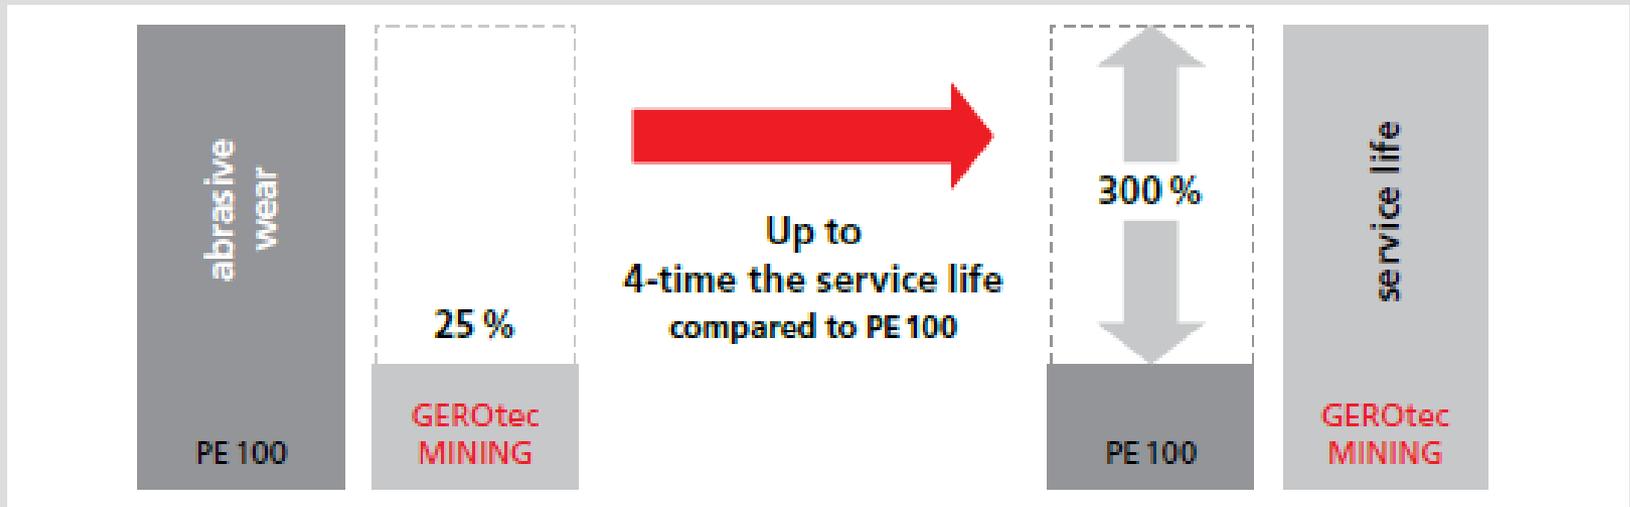

The more elastic the pipe material

The less abrasion in the pipe.

Integration of a functional „*elastic*“ inner layer for improvement of abrasion resistance of inner pipe surface and
=> increase of operational lifetime of the pipe

Increased service time - long lifetime

Practical test of abrasion

Test series in concrete plant / Fa. Beton Etzel+Linth in Uznach (CH)

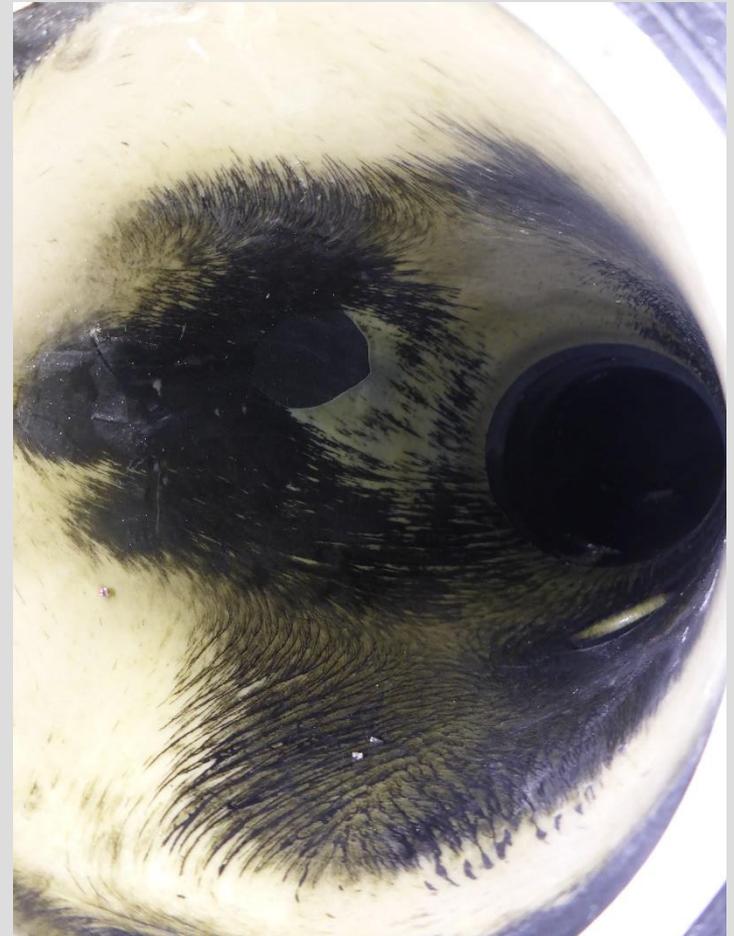

- Normal operation of concrete plant
 - Long term test in **maximal** stressed pipe section
 - Flowing sand-gravel mixture with sidewise blown aggregate
-
- Standard pipes made of PE100 in different test series with operation time between 2 and 8 weeks are worn out and can not be used anymore
-

Practical test of abrasion

Practical test

- GEROtec MINING pipes are since **6 months** in test operation
- Result of intermediate check:
Pipe is not worn-out and can be further used

Robust, efficient, economical

- | | | | |
|-----------------------------------|---|-------------------------|---|
| ■ Low abrasive worn-out | ➤ | High service life | ■ |
| ■ Good processing | ➤ | Short installation time | ■ |
| ■ Improved heat reflection | ➤ | Low thermal stress | ■ |
| ■ Inspection friendly inner layer | ➤ | High maintainability | ■ |

Low installation-, operation and maintenance costs

Joining technology

Flange connection

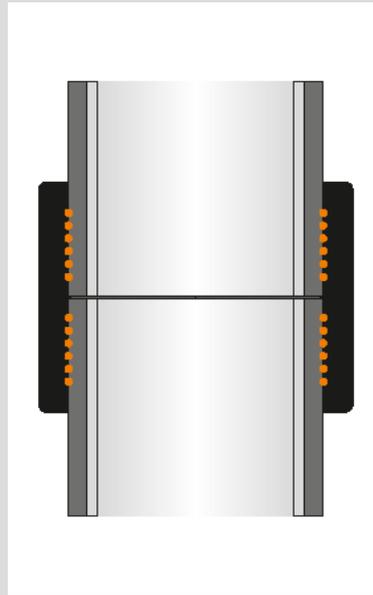

Joining technology – welding methods

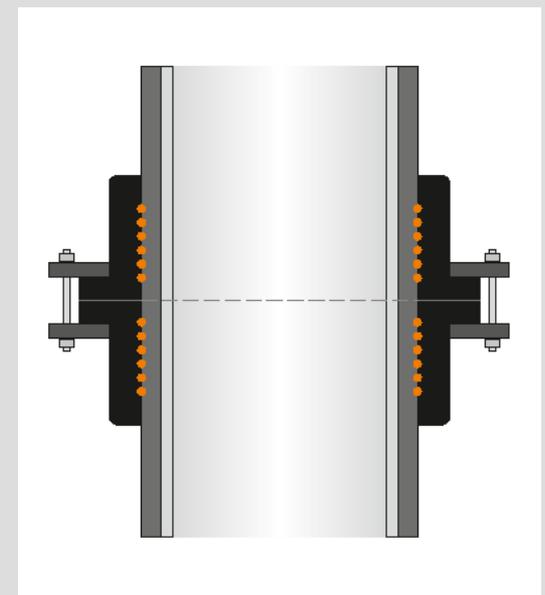

■ Butt welding

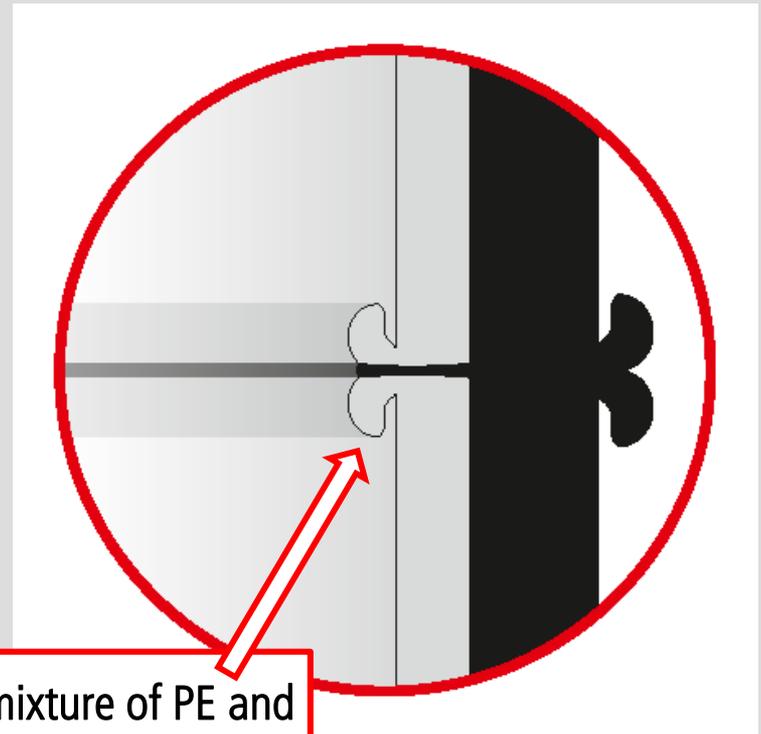

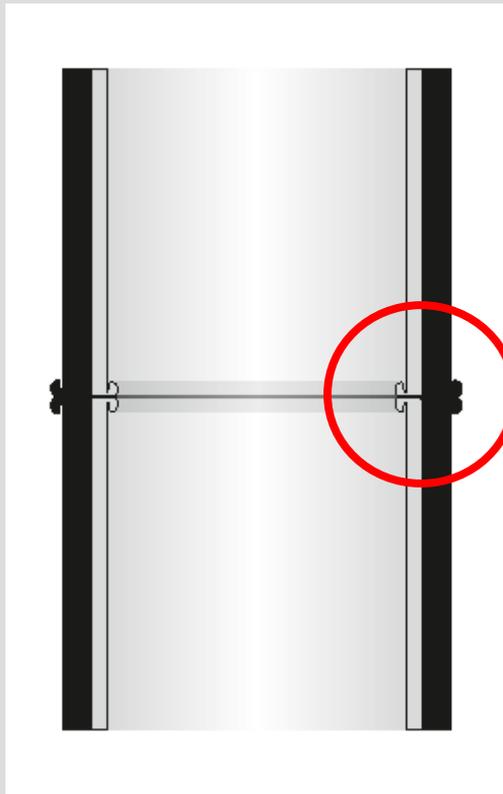

■ Electrofusion welding

■ GEROtec MINING weld-on flange

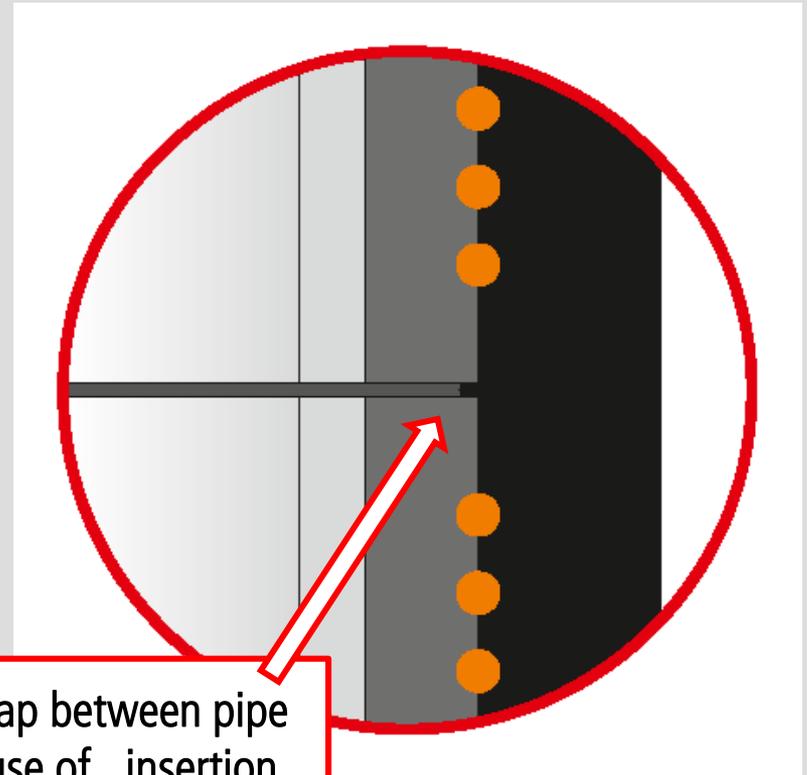

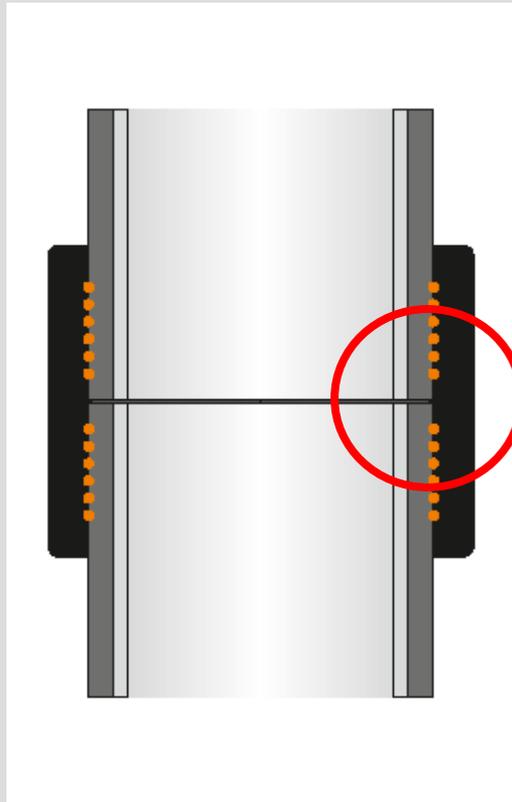

Butt welding

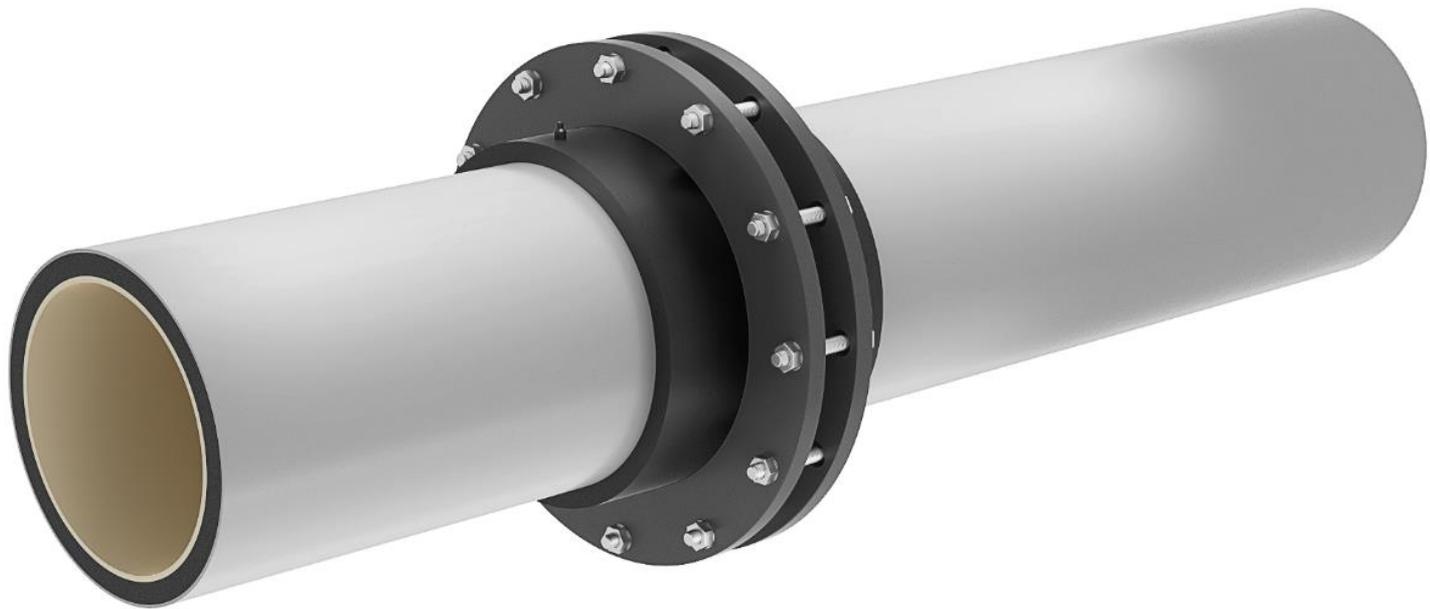

Critical beat mixture of PE and thermoplastic elastomer

Electrofusion welding

Sensitive gap between pipe ends because of „insertion depth limiter“

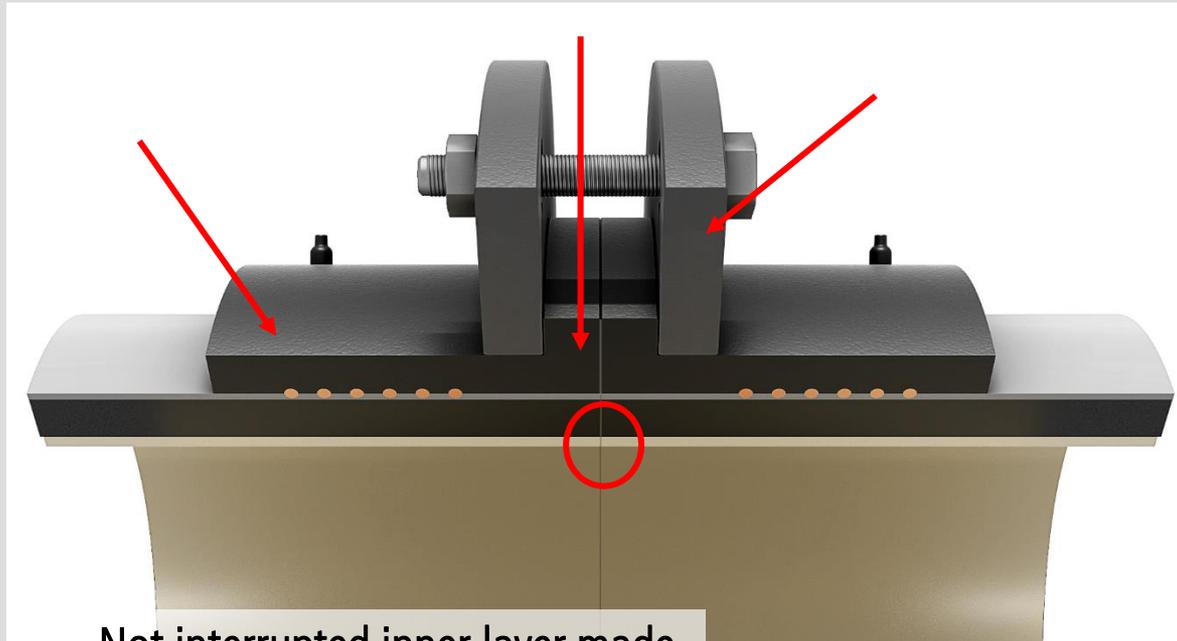

GEROtec MINING – weld-on flange

GEROtec MINING weld-on flange

Intelligent combination made of stub-end, e-coupler and a flange connection

Not interrupted inner layer made of thermoplastic elastomer

- Removable pipe connection ■
- Connection with other pipe materials ■
- Continuous abrasion resistant inner layer ■

Conservative design – SDR-classes and dimensions

Advantages and chances

- Low material costs
 - Low installation expenses
 - ▶ Minimization of investment costs

 - High service time
 - Long lifetime
 - ▶ Low operation- and maintenance costs
-

Wear resistant pipelines made of PE show a high economic efficiency compared to traditional used materials like steel or rubber.
