New Version of Variable Area Flowmeters Type 335/350

New Version of Variable Area Flow Meter Type 335/350

We are pleased to announce that we have released an improved version of the Variable Area Flow Meter Type 335 and Type 350

The new version has been updated to match the recently updated standard VDI/VDE 3513 (accuracy class).

All installation measures and scale ranges remain the same. There is also no price difference between the old and the new version.

New codes

We have created new codes for all standard items of the Type 335/350 to ensure traceability between the old and the new version. Only the first 3 digits of the code have changed – the other digits remain the same:

- Old version: 198xxxxxx
- New version: 199xxxxxx

Spare parts compatibility new/old

Please note that the flowmeters DN 50 with scale range 600-6000 l/h and 1000-10000 l/h will now come with a guiding rod; therefore, the new float for these two scale ranges has a bore now and, if you want to use it for the old flowmeter versions, a guiding rod as well as the appropriate inserts will be also needed.

All other spare parts with new codes, e.g. tubes, special scales and floats can be used with the old version, too.

Phase out and availability

The new codes are available and some of you may have already received them as a direct replacement for old items that went already out of stock.

Old codes will be available until the current stock is sold out
